EXPERIENCE

META - AI

Software Engineer June 2026 - Present

- Mapped deviations between successful third-party and failed Meta coding-agent trajectories to create **trace-correction** tasks for downstream training and evaluation.
- Built core components of an **agent-data pipeline** that recover task context from traces, preserve provenance, and package failed runs into schema-validated training/evaluation records.
- Designed state and orchestration for **research-derived coding candidates**, including watermarking, version-aware deduplication, transactional persistence, failure-safe recovery, testing, and release automation.

META - WhatsApp

Software Engineer August 2025 - June 2026

- Shipped consumer-facing **iOS** features supporting username adoption in large group chats, reducing notification noise from username and membership changes while preserving user transparency; rolled out to **2B+ users** with zero production incidents.
- Reduced friction in username adoption through banners, upsells, and **username suggestion logic**, streamlining setup ahead of global rollout.
- Improved **accessibility** and **internationalization** across the Usernames experience by adding **screen-reader** support and resolving **localization** and usability issues ahead of global rollout.

NETFLIX

Software Engineer Intern June 2024 - September 2024

- Built an internal **Flask**/**DynamoDB API** for account data used by Netflix Cloud Infrastructure Security, replacing a complex workflow with a configurable service for frequent lookup, filtering, and writes.
- Hardened the service with **Pydantic validation**, **pytest/moto tests**, **structured logging**, and **thread-safe background caching**, and deployed/debugged it through **Spinnaker** preview environments and rollbacks.

Language Acquisition Lab - UCLA

R Developer April 2023 - August 2023

- Built an **R**/**Shiny** corpus exploration tool that fetched, organized, and visualized infant speech data, enabling researchers to efficiently search recordings and identify phonetic patterns for further study.
- Added audio clipping, **Praat**-based data retrieval, caching, and search across **40,000+** speech samples.

PROJECTS (github.com/ayangelah)

Mobile Pupillometry | ayangelah.me

- Fine-tuning a lightweight segmentation model to localize pupils in smartphone video and extract clinically relevant pupillary measurements.
- Evaluating generalization with **subject-level K-fold cross-validation**, preventing frames from the same subject from leaking across train/validation folds.

GPT-2 Mechanistic Interpretability:

- Implemented **QK/OV circuit analyses** across all 144 attention heads in GPT-2 Small to identify induction, previous-token, copy, and copy-suppression behavior.
- Used **activation patching** to causally test candidate circuits, finding evidence that induction behavior is distributed across multiple heads rather than recoverable through single-head interventions.

EDUCATION

University of California, Los Angeles (UCLA)

Bachelor of Science, Computer Science & Linguistics September 2021 - June 2025

- GPA: 3.738
- **Relevant Coursework:** Machine Learning, Artificial Intelligence, Algorithms & Complexity, Linear Algebra, Data Management Systems, Operating Systems, Computer Architecture, Computational Linguistics
- **Languages:** Python, C++, SQL, Swift, R, JavaScript/TypeScript
- **ML/Data:** PyTorch, scikit-learn, NumPy, pandas; transformers, computer vision, model evaluation
- **Systems/Tools:** Linux, Docker, Flask, AWS, DynamoDB, Git
